National competition on-line test

A theoretical question database should be built (for example: between 100-1000 questions). The following 6 topics are suggested but you are free to add or take out some.

- Traffic regulations
- Safe driving
- First Aid
- Automotive
- Basic understanding of automotive engineering
- Knowledge about our club

Theoretical questions can also be prepared based on driving exam documents.

On-line test can be done on Google form with question being input manually and, for example can consist of:

- 4 general automotive questions
- 7 traffic rule questions
- 3 safe driving questions
- 2 First Aid questions
- 1 Club question
- 3 basic automotive engineering questions

Google form can generate questions randomly so participants who wish to do the test more than more than one time have a small chance to receive the same question.

Typically, 15-30 seconds are given to participants to answer a question. Total number of questions asked per participant can be between 20-30. You can decide the total number of participants depending on your capacity

You may set the number of attempts per participant, the interval between attempts, and the overall duration of the prequalification/theoretical test. Classification can be updated after each test, and you can choose to publish the classification and give time for possible protests.
